

Loose teeth - resetting

Posted by Urian - 2008/08/12 08:26

I had an accident a few days ago and unfortunately two of my teeth - a canine and an incisor has loosened. They shake and I am afraid they are dislodged. Is it possible to set them in such a way that they are tightened? May be reattach or may be stimulate the muscles in that area to grow or any surgical options that helps me retain my own teeth but make them tighter if you know what I mean!

Hi Urian,

If the root is broken, the tooth cannot be saved, visit your dentist to have it removed and an implant fitted. If it is slightly loose, it may heal without intervention, if significantly loose it may need splinting. A visit to your dentist is essential, only a dentist can decide what can be done.
